

# Shadybug's Firecracker At Tikokino

**THE KENNEL CLUB**  
Making a difference for dogs

**Breed** Retriever (Labrador)  
**Sex** Dog  
**Colour** Yellow

## Health Tests

---

### DNA

There are DNA tests available for specific conditions in some breeds. A result or status will show only if the dog has been DNA tested or is hereditarily clear of the condition for which there is a DNA test.

DNA tests can show whether an individual dog is genetically clear (no copies of the disease gene), a carrier (one copy of the disease gene) or affected (two copies of the disease gene) for a particular condition or disease. This is very useful information for breeders, and breeding advice will vary according to the disease/condition in question.

### Key to DNA tests

GPRA-rcd1	Generalised progressive retinal atrophy - rcd1
GPRA-rcd3	Generalised progressive retinal atrophy - rcd3
CLAD	Canine leucocyte adhesion deficiency
vWD	Von Willebrand Disease
CSNB	Congenital stationary night blindness
FN	Familial nephropathy
GPRA cord-1	Generalised progressive retinal atrophy - cord-1
L-2HGA	L-2-hydroxyglutaric aciduria
HC-1	Hereditary cataract - 1
JHC	Juvenile hereditary cataract
prcd-PRA	Progressive rod cone degeneration - Progressive retinal atrophy
PDP-1	Pyruvate dehydrogenase phosphate 1 deficiency
CL	Ceroid lipofuscinosis
TNS	Trapped neutrophil syndrome
Fuco.	Fucosidosis
CEA/CH	Collie eye anomaly / Choroidal hypoplasia

Test	Result/Status	Date
prcd-PRA	Hereditary Clear	2nd July 2008
CNM	Clear	23rd April 2009

### Elbow Grade

An elbow grade is a measure of any evidence of elbow dysplasia (abnormal development). Both elbows are graded (between 0-3), but only the highest grade is used as an overall elbow grade for the dog. The lower the grade the better, with the advice given to breeders to ideally breed from dogs which have an elbow grade of 0 or 1.

Test	Result	Date
Elbow Dysplasia	0	20th August 2009

---

## Hip Score

A hip score is a measure of evidence of hip dysplasia (abnormal development). Scores for each hip are added together to get an overall hip score for a dog. Scores range from 0 to 106, with the lower the score the better. The advice to breeders is to ideally breed only from dogs which score below the breed average.

Test	Result	Date
Hip Dysplasia	3/3 = 6	20th August 2009

---

## Eye Screening

There is a set list of breeds and eye conditions, known to be inherited in those breeds and that are certified under the Eye Scheme.

### Key to eye conditions

CEA	Collie eye anomaly
CHC	Congenital hereditary cataract
G	Glaucoma
HC	Hereditary cataract
PHPV	Persistent hyperplastic primary vitreous
PLL	Primary lens luxation
PPM	Persistent pupillary membrane
CPRA	Centralised progressive retinal atrophy
GPRA	Generalised progressive retinal atrophy
MRD	Multifocal retinal dysplasia
TRD	Total retinal dysplasia

In general, it is recommended that eyes are examined annually (except for glaucoma predisposition which is only done once), with the advice given to breeders to only breed from dogs that are found to be unaffected (or clear) of all known conditions in the breed.

Test	Result	Date
Eye Disease	Unaffected	20th October 2009

---

For more information on health screening schemes and to get an idea of screening currently relevant to this breed, please see the Accredited Breeder Scheme - Breed Specific Requirements and Recommendations at [www.thekennelclub.org.uk](http://www.thekennelclub.org.uk)
